

FIT PASSPORT

Logo Concept

The Fit Thread / Ariadne Thread Signet

Selected concept: The Fit Thread

One thread through the maze of fit.

August 27, 2026

1. Brand and Product Foundation

Fit Passport is a consumer-owned, portable fit identity. It remembers measurements, fit preferences, garments that already work, and the outcomes of past purchases. That memory travels across brands and stores instead of remaining trapped inside one retailer.

The logo therefore should not represent only measurement, clothing, or shopping. It should represent a more durable idea:

A person can carry the memory of what fits.

The mark must feel fashion-first rather than software-first: editorial, refined, personal, timeless, tailored, gender-neutral, and quietly premium. It should remain useful if Fit Passport later extends from apparel into shoes, rings, pet gear, and other size-dependent categories.

2. The Selected Form

The selected mark is a continuous, thread-like monogram that resolves into an abstract FP. Its leftward entry, circular turn, shared structure, and descending loop create a sense of movement without illustrating a literal object.

The design can be read at several levels:

Visual cue	Brand meaning
A single continuous line	One fit identity carried across many stores
A thread	Clothing, construction, continuity, and remembered experience
A route through a turn	Navigation through inconsistent sizing
An abstract FP	Immediate ownership by Fit Passport
A folded ribbon or label	Garment construction, fashion, and a passport page
A compact signet	Personal identity, verification, and an owned record

The mark should remain suggestive rather than literal. Its strength comes from allowing these meanings to coexist.

3. Primary Myth: Ariadne's Thread

In Greek mythology, Ariadne gives Theseus a thread to unroll as he enters the Labyrinth, allowing him to find his way out. The Metropolitan Museum of Art recounts this episode in its overview of Theseus and in an artwork depicting Ariadne giving him the thread.

For Fit Passport, the metaphor maps naturally onto the product:

Myth	Fit Passport
The Labyrinth	Conflicting size labels, regional systems, and brand-specific cuts
The thread	A user's accumulated fit memory
The route already traveled	Garments tried, kept, returned, exchanged, or re-rated
The guide back out	An explainable recommendation based on prior evidence

Myth	Fit Passport
Ariadne's intelligence	A system that helps the user navigate without taking ownership away

The brand should center Ariadne as the provider of orientation and memory, not the violence of the Minotaur story. The public-facing idea is simple:

Across brands, sizing becomes a labyrinth. Fit Passport keeps the thread.

This is not a claim that the monogram is an ancient Greek symbol. The myth is a narrative lens for a contemporary mark.

4. Material Metaphor: The Weaver's Shuttle

In tapestry weaving, weft thread is carried back and forth through warp threads, historically with a handheld shuttle, until an image or pattern emerges. This provides a second, materially grounded reading of the mark.

Each purchase or fit outcome is one pass of the thread. Over time, those passes form a personal pattern: a fit identity that is more useful than any isolated size label.

The selected mark should only suggest a shuttle, loop, or folded textile. It should not become a literal sewing tool, spool, or craft-store icon.

5. Identity Metaphor: The Personal Signet

The final layer is the signet or passport stamp. Fit Passport is not merely a recommendation widget; it is an identity layer owned by the consumer. A compact monogram can function like a personal seal across:

- the Fit Passport identity card;
- exported passport images;
- verified fit records;
- profile avatars and membership marks;
- garment evidence and recommendation receipts;
- future physical labels, cards, or event materials.

The mark should feel authoritative without becoming governmental, bureaucratic, or security-oriented.

6. Supporting Formal References

Folded ribbon and garment label

The line may feel like fabric folded back on itself, a garment label, or a passport page turning. This keeps the form connected to fashion and portability without drawing a literal shirt, hanger, measuring tape, or passport booklet.

Continuous path and meander rhythm

Classical meander patterns use continuity and repeated turns to establish rhythm. The logo may borrow this sense of a path that persists through changes, but it should not reproduce a historical motif or become a literal maze.

Fit as accumulated memory

The mark is not a static measurement. It is a path: observations are added, preferences change, bodies change, and the profile learns. This is why a continuous line is more accurate to the product than a ruler or body silhouette.

7. What the Mark Should Not Become

The selected concept must be refined so that it does not read as:

- a hammer, Mjolnir, axe, or weapon;
- an umbrella, key, flag, mushroom, or letter T;
- a literal labyrinth, spool, needle, hanger, mannequin, or passport;
- a generic technology loop, chain link, or fintech emblem;
- an ornamental Greek symbol presented as if historically authentic.

The Ariadne narrative fits the product; Thor's hammer does not. Strength, combat, and Norse fantasy would pull the identity toward gaming or masculine sports branding and away from fashion, memory, and personal fit.

8. Refinement Principles

The final vector should preserve the character of the selected upper-left concept while improving optical balance.

1. Keep the feeling of one continuous thread.
2. Preserve the open left entry and the descending lower loop.
3. Keep the FP monogram discoverable but not typographically obvious.
4. Avoid a heavy, oversized top bar or a centered handle-like stem.
5. Use deliberate, clean Bezier curves and consistent optical stroke weight.
6. Remove raster softness, accidental joins, shadows, grey highlights, and gradients.
7. Reduce the production mark to approximately one to three principal paths.
8. Test at 16, 24, 32, 48, and 128 pixels.
9. Create solid black, reverse white, outline, and micro-mark variants.
10. Confirm that the silhouette works before introducing color.

9. Motion System

The selected mark is especially valuable because its static logic can become motion without inventing a separate animation language.

Primary animation: Thread Draw

1. A thread enters from the left.
2. It travels through the upper turn and forms the hidden FP structure.
3. The lower loop completes the identity.
4. The final mark settles with a restrained fabric-like easing.

Recommended duration: 600-900 ms for an interface reveal and 1.2-1.8 s for a brand introduction.

Secondary animations

- Fold reveal: one segment turns like a folded label or passport page.
- Signet press: a subtle downward compression and recovery for confirmation states.

- Thread pulse: a restrained path highlight for loading or profile-learning states.

Motion must remain quiet and editorial. Avoid continuous spinning, neon trails, elastic cartoon motion, or heavy 3D simulation.

10. Monochrome First, Color Second

The master logo must be approved in pure black and white. Color should identify the brand, not rescue the geometry.

Core neutrals

Role	Color	Hex
Primary ink	Ink Black	#171416
Light ground	Warm Ivory	#F3EFE7
Reverse	White	#FFFFFF

Accent candidates to test after silhouette approval

Candidate	Hex	Intended character
Oxblood	#781F2B	Recommended core accent; mature, editorial, fashion-led
Deep Aubergine	#2B172C	Artistic, nocturnal, restrained luxury
Ultramarine	#2737B8	Contemporary art and runway energy; use carefully to avoid a technology feel

Recommended starting system: Ink Black + Warm Ivory + Oxblood. Metallic finishes belong to the badge and passport-material system, not the master logo.

11. Asset Format: What We Should Keep

Source of truth

Use a clean vector master in one of these editable formats:

- Figma component for collaborative design and layout;
- SVG as the canonical digital export;
- PDF or EPS vector for professional print handoff if required.

Delivery package

Format	Purpose	Notes
SVG	Website, app, motion, scalable UI	Preferred production format; optimize but keep an editable master
PNG	Social profiles, documents, systems that reject SVG	Export transparent versions at 1x, 2x, and 4x
WebP/AVIF	Raster web fallback	Useful for large branded graphics, not necessary for a tiny logo

Format	Purpose	Notes
PDF vector	Print, decks, vendors	Preserve vector paths and embedded color profile
EPS	Legacy print/vendor workflow	Only when a vendor explicitly requests it
ICO	Windows favicon	Generate from the approved micro-mark

Do not use JPG for the logo master. JPG introduces compression artifacts and has no transparency.

12. How to Extract the Selected Upper-Left Mark

We now have a six-file source-export set, organized and documented in

[assets/logo/README.md](#). The two immediate-use PNGs are:

- [fit-passport-mark-black-transparent.png](#) - RGBA with transparency, suitable for immediate prototypes and documents;
- [fit-passport-mark-black-on-white.png](#) - RGB on white, suitable for simple decks and references.

The transparent file keeps generous canvas padding; the visible artwork occupies approximately 538 × 503 px near the center. These are useful delivery assets, but they remain raster files and cannot become the editable master by themselves.

The supplied SVGs contain real vector paths. The transparent SVG is the best current reconstruction source, but it still includes a white correction path that must be removed before recolouring or reverse use. The supplied PDFs each contain a flattened RGB JPEG rather than vector paths; the export labelled transparent is also flattened to white. They are preserved in [assets/logo/source-exports/](#) as references, not treated as print masters.

Best workflow: return to the generating design file

1. Open the Recraft or original design project.
2. Select only the upper-left mark.
3. Export it as SVG with no background.
4. Import the SVG into Figma.
5. Outline strokes only after preserving an editable stroke-based copy.
6. Remove hidden objects, masks, duplicate points, gradients, and stray shapes.
7. Adjust curves and intersections manually at 800-1600% zoom.
8. Create an optical micro-mark rather than mechanically scaling the full mark.

If only the PNG remains

1. Use the isolated transparent PNG rather than cropping the original four-panel concept sheet.
2. Place it in Figma at reduced opacity and lock it as a reference layer.
3. Rebuild the line manually with the Pen tool; do not rely on one-click bitmap tracing as the final result.
4. Use as few anchor points as possible.
5. Normalize curve tangents and optical stroke weight.
6. Convert strokes to outlines in a duplicate frame.
7. Inspect joins and negative space at both 16 px and large print size.

Automatic vectorization may be used as a starting point, but it usually creates too many points and preserves raster imperfections. Manual reconstruction is the correct final step for a logo this simple.

13. Recommended Repository Asset Structure

```
app-web/public/brand/  
logo-mark.svg  
logo-mark-reverse.svg  
logo-mark-micro.svg  
logo-lockup-horizontal.svg  
logo-lockup-stacked.svg  
favicon.svg  
favicon.ico  
logo-mark-512.png  
  
docs/design/brand/  
fit-passport-logo-master.fig # link or export reference, if appropriate  
fit-passport-logo-print.pdf  
fit-passport-logo-outline.svg
```

The application should reference SVG files rather than embedding large PNG or 3D assets. A simple logo SVG should normally remain only a few kilobytes after careful optimization.

14. Application Rules

Clear space

Use the width of the inner thread stroke as the minimum clear space on all sides. Increase it for editorial layouts.

Minimum size

- Full mark: do not use below 24 px until small-size testing is complete.
- Micro-mark: target 16 px and favicons.
- Print: verify line survival at approximately 8 mm wide.

Backgrounds

- Use Ink Black on Warm Ivory or white.
- Use white on Ink Black or sufficiently dark photography.
- Use Oxblood only after the monochrome mark is approved.
- Never add a drop shadow, glow, bevel, or outline merely to increase contrast.

Lockups

Maintain separate approved files for:

- mark only;
- horizontal mark + “Fit Passport” wordmark;
- stacked lockup;
- micro-mark;
- motion source.

Do not retype the wordmark ad hoc in product screens.

Badges

Badges may use metallic depth, material textures, and tier colors later. They should inherit the thread/path geometry from the logo, but they must not force the master logo into 3D. The logo remains flat and lightweight; the badge system can carry richer dimensional expression.

15. Production Checklist

- ☐ Obtain or reconstruct the upper-left mark as a true vector.
- ☐ Complete optical curve cleanup in Figma or Illustrator.
- ☐ Reduce path and anchor-point count.
- ☐ Approve black-on-white and white-on-black versions.
- ☐ Test the mark at 16/24/32/48/128 px and at 8 mm print width.
- ☐ Check for unintended hammer, umbrella, key, flag, and T readings.
- ☐ Build mark-only, horizontal, stacked, and micro lockups.
- ☐ Select one accent after monochrome approval.
- ☐ Export SVG, PNG, PDF vector, favicon, and motion source.
- ☐ Optimize SVG and verify accessibility/contrast in the product.
- ☐ Perform a professional trademark similarity search before public launch.

16. Core Brand Language

Recommended public line

One thread through the maze of fit.

Product explanation

Across brands, sizing becomes a labyrinth. Fit Passport keeps the thread: what you wore, how it felt, and what worked. The mark is a single thread folded into FP, a personal signet that guides you back to your fit.

Internal creative statement

The logo is not a picture of clothing. It is the memory that travels through clothing.
